

General Comments on the midterm evaluation of
Semester Project

Prof. K.R. Chowdhary

March 31, 2015

- All the formulas and variables are to be put in maths format:

The variables should be put as u, v , subscripted variables as a_i, a_j , etc.

- Equation without equation number as:

$$s = \sum_{i=0}^n$$

- With equation number as:

$$s = \sum_{i=0}^n \tag{1}$$

- Text is not aligned at many places
- Figures are too large. You can reduce it by scale:

- In many cases the references included are only the website names. Include the relevant articles as references, and in a proper format.
- Some people have kept the old matter (template matter) in a part as it is, e.g., the equation “sin .. + cos...” !! This has no relation to your article !!
- Almost 40-50% weight is whether the article is in proper format or not?
- You can always download tutorial guide for latex. There are latex forums, from where you can query small problem, e.g., “How to represent the matrices in latex?”.
- Discuss about the format and contents with friends to improve on it.
- Any kind of copying (plagiarism) shall be electronically checked. Both the groups sharing the contents shall be at disadvantage.
